Contents

Safety in tunneling	1
<i>Yannis Bakoyannis</i>	
1 Introduction	1
2 Definitions	3
3 Tunnel design life and performance requirements	6
3.1 Tunnel design life	6
3.2 Tunnel performance requirements	10
4 Risks in tunneling	14
4.1 Risk	14
4.2 Risk acceptance criteria	15
4.3 Risk management	22
4.4 Risk Analysis	23
4.5 Risk elimination and risk mitigation measures	30
4.6 Risks in risk management	35
5 Safety during construction period	36
5.1 Legislative framework	36
5.2 Safety and risk management issues	39
6 Geotechnical and structural safety issues	42
6.1 Structural design of primary (shotcrete) lining	42
6.2 Structural design of final lining	44
Engineering decisions based on hazard assessment	49
<i>Dieter Fellner</i>	
1 Introduction	49
2 "Recipes" and examples	52
3 Some comments on rock mass properties	55

4	How does the hazard approach work?	57
5	Geotechnical hazards and calculations	58
6	Example for hazard approach in execution stage	60
7	Hazard approach & TBM feasibility / TBM selection	62
8	Hazard approach & overflow spillway transition tunnel	63
9	Final comments / suggestions	67
Blasting methods in tunneling		71
<i>Mark Ganster</i>		
1	Introduction	71
2	General	72
2.1	The tunnel portal and initial approach	72
2.2	Tunnels	72
3	Drilling	73
3.1	General	73
3.2	Types of cut	74
3.3	Drilling pattern	78
4	Explosives – Loading	80
4.1	Definition	80
4.2	General	80
4.3	Emulsion explosives	80
4.4	Nitroglycol-based explosives (dynamites)	83
4.5	Loading	84
5	Initiation	84
5.1	General	84
5.2	The cut	85
5.3	The production holes	86
5.4	The contour	86
5.5	The lifters	86

Injection for waterproofing and ground improvement in under-ground construction	87
<i>Knut F. Garshol</i>	
1 Introduction	87
1.1 Reasons for grouting in tunneling	87
1.2 Short explanation of the Subject	87
1.3 Traditional cement based grouting technology	89
1.4 Rationale for the increase in the use of pressure grouting .	90
1.5 Some comments on Post-grouting	93
1.6 New time saving methods and materials technology	94
2 Grouting into rock	96
2.1 Particular features of rock (compared to soil)	96
2.2 Handling of rock conductivity contrast	100
2.3 "Design" of grouting in rock tunnels	103
2.4 Fluid transport in rock	106
2.5 Practical basis for injection works in tunnelling	107
2.6 Grout quantity prognosis	110
3 Functional requirements	111
3.1 Requirements and ground water control	111
3.2 Measurement of water ingress to the tunnel	112
4 Cement based grouts	113
4.1 Basic properties of cement grouts	113
4.2 Durability of cement injection in rock	122
5 Chemical grouts	123
5.1 Polyurethane grouts	124
5.2 Silicate grouts	127
5.3 MBT colloidal silica	127
5.4 Acrylic grouts	128
5.5 Epoxy resins	129
5.6 Combined systems of silicate and acrylic materials	130
5.7 Bitumen (asphalt)	130

Exploration by core drilling	135
<i>Martin Happel</i>	
1 Introduction	135
2 The coring system	136
3 Core barrels	136
3.1 Single tube core barrel	136
3.2 Double tube core barrels	137
3.3 Wire-line core barrel	139
4 Flushing	143
5 Bits, core bits	144
Tunnel support ahead of the face with pipe roofs or forepoling	147
<i>Wolfgang Holzleitner, Franz Deisl, Wolfgang Holzer</i>	
1 Introduction	147
1.1 Review of the development	147
2 General observations	148
2.1 The action of 'ahead-support'	148
2.2 Scope of ahead-support	149
3 Ahead-support with forepoling	150
3.1 Types of forepolings – Definitions	150
3.2 General rules for the execution of forepoling	152
3.3 The advantage of forepoling poles or pipes	154
3.4 Disadvantages of forepoling pipes or poles	154
4 Ahead-support with pipe roofs	154
4.1 Selection of pipe roof pipe diameter	154
4.2 Features of pipe roof pipes	155
4.3 Types of grouting	156
4.4 Advantages of pipe roofs	157
4.5 Disadvantages of pipe roofs	158
5 Contractual aspects	159

5.1	Who bears the risk of overbreak	159
5.2	Ahead-support in the design drawings	159
6	Summarizing comparisons	160
6.1	Length ahead of the face	160
6.2	Excavation cross-sections under pipe roofs	160
6.3	Omission and reinstatement of pipe roofs	160
6.4	Forepoling and the influence on excavation costs	161
6.5	Comparison of advance rates	163
7	Summary	163

New approaches in tunnelling with composite canopies – installation-design-monitoring **165**

Ernst F. Ischebeck

1	Introduction to micropiles	165
2	Design of composite canopies	166
3	Monitoring and site experiences	170

Lighting of road tunnels in Austria **173**

Rudolf Koller

1	Introduction	173
2	Guidelines and regulations – national and international	174
3	Definitions	175
3.1	Tunnel related zones	175
3.2	Lighting definitions	177
3.3	Tunnel specific definitions	179
3.4	Traffic related definitions	182
3.5	Lighting systems	183
4	Tunnel lighting design	185
4.1	Introduction	185
4.2	Configuration of traffic	185
4.3	Stopping distance	185

4.4	Maintenance factor	186
4.5	Day-time lighting for long tunnels	187
4.6	Lighting in the threshold zone	190
4.7	Luminance in the transition zone	190
4.8	Daytime luminance in the interior zone	191
4.9	Luminance in the exit zone	192
4.10	Parting zone lighting	192
4.11	Lighting of the walls	192
4.12	Lighting of lay-by niches	192
4.13	Night-time lighting	193
4.14	Emergency lighting	193
4.15	Uniformity of luminance	193
4.16	Glare restriction	194
4.17	Restriction of the flicker effect	194
4.18	Daylight variation and lighting control	196
5	Measurement of tunnel lighting installation	197
5.1	Quality numbers for tunnel lighting installations	197
5.2	Measuring fields	197

Rock reinforcing **199**

Dimitrios Kolymbas

1	Introduction	199
2	Impact of pattern bolting	199
3	Ground stiffening by pre-stressed anchors	201
4	Transmission of shear stress	204
5	Multiphase model of reinforced ground	206
6	Reinforcement of the face	213

Tunnelling with soil freezing	215
<i>Wolfgang Orth</i>	
1 The principle of soil freezing	215
2 How to freeze soil	215
3 The mechanical behaviour of frozen soil	217
4 Examples of ground freezing in tunnelling	218
4.1 Longitudinal freezing pipes	218
4.2 Staggered freezing pipes	220
4.3 Freezing from a pilot adit	221
4.4 Soil freezing for jacking a tunnel frame	222
The start of hydroshields - risk assessment under high water pressure	225
<i>Jürgen Schwarz</i>	
1 Tunnelling machine	225
1.1 EPB-machines	225
1.2 Slurry-Shield	227
2 Shafts	227
3 Machine start	229
3.1 Requirements on the sealing at the start shaft	229
3.2 Phase 1: Break-open the face wall	231
3.3 Phase 2 - Penetration into the sealing body	233
3.4 Phase 3 - Drive out from the sealing body	235
4 Conclusion	236
Geotechnical risks for tunnel drives with shield machines	239
<i>Markus Thewes</i>	
1 Introduction	239
2 Geotechnical risks for tunnel drives with shield machines	239
3 Clogging in clay formations	241
3.1 Development from first clogging to standstill	242

3.2	Clogging potential	243
3.3	Laboratory test to define clay adhesion	243
3.4	Identifying and classifying soils with clogging potential . .	245
3.5	Preventive measures against clogging	246
3.6	Operational measures against clogging	247
3.7	Experience from a successful tunnel drive	248
3.8	Geotechnical studies for future shield drives	250
3.9	Adhesion tests in practice	251
3.10	Recommendation for risk analyses	251
4	Maintenance work in the excavation chamber	251
5	Mixed tunnel face with soil and hard rock	255
5.1	Mixed-face conditions for EPB-shields	256
5.2	Mixed-face conditions for slurry-shields	261
5.3	Improvements for shield drives in mixed-face geology . . .	262
5.4	Comparison of the two systems	264
6	Joint code of practice for risk management of tunnel works	266
Earthquake resistant design of tunnels		269
<i>Christos Vrettos</i>		
1	Introduction	269
2	Effects of ground motion on tunnels	270
3	Definition of seismic action	272
4	Geotechnical exploration and ground parameters	272
5	Design principles	275
6	Axial and curvature deformation analysis	276
6.1	Structure conforming to ground motion	278
6.2	Consideration of soil-structure interaction effects	281
6.3	Influence of transverse joints	285
6.4	Global tunnel response	286
7	Ovaling and racking deformation analysis	286
