Invariant Manifolds and Dispersive Hamiltonian Evolution Equations

European Mathematical Society

Contents

1	Introduction	1
2	The Klein–Gordon equation below the ground state energy	17
	2.1 Basic existence theory	20
	2.2 Stationary solutions, ground state	29
	2.3 The Payne–Sattinger criterion, regions $\mathcal{P}\mathcal{S}_{\pm}$	34
	2.4 Scattering in $\mathcal{P}\mathcal{S}_{+}$	37
	2.5 Strichartz estimates for Klein–Gordon equations	63
	2.6 Summary and conclusion	77
3	Above the ground state energy I: Near Q	79
	3.1 Energy landscape	80
	3.2 Center, stable, and unstable manifolds in hyperbolic dynamics	85
	3.3 Center-stable manifolds via the Lyapunov–Perron method	108
	3.4 Dispersive estimates for the perturbed linear evolution	117
	3.5 The center-stable manifold for the radial cubic NLS in \mathbb{R}^3	130
	3.6 Summary and conclusion	143
4	Above the ground state energy II: Moving away from Q	145
	4.1 Nonlinear distance function, eigenmode dominance, ejection	145
	4.2 J and K_0, K_2 above the ground state energy	158
	4.3 The one-pass theorem	162
	4.4 Summary and conclusion	170
5	Above the ground state energy III: Global NLKG dynamics	173
	5.1 Statement of the main results on global dynamics	174
	5.2 The blowup/scattering dichotomy in the ejection case	177
	5.3 Proofs of the main results	182
	5.4 Summary and conclusion	188
6	Further developments of the theory	191
	6.1 The nonradial cubic NLKG equation in \mathbb{R}^3	194
	6.2 The one-dimensional NLKG equation	204
	6.3 The cubic radial NLS equation in \mathbb{R}^3	218
	6.4 The energy critical wave equation	232
