About the book series	vii
Editorial board of the book series	ix
Preface	xxi
Acknowledgements	xxiii
About the editors	xxv
Contributors	xxvii

Section 1: Fundamental concepts

1	Relative permeability	3
	<i>(T.J.T. Spanos)</i>	
1.1	Introduction	3
1.2	Darcy's equation	4
1.3	Heterogeneity	6
1.4	Lubrication theory	9
1.5	Multiphase flow in porous media	11
1.6	Dispersion	18
1.7	Few comments about the associated thermodynamics	20
1.8	Conclusions	20
1.A	Appendix	20
	1.A.1 Solid properties	20
	1.A.2 Fluid properties	22
	1.A.3 Reciprocity	22
	References	25
2	From upscaling techniques to hybrid models	
	<i>(I. Battiato & D.M. Tartakovsky)</i>	27
2.1	Introduction	27
2.2	From first principles to effective equations	28
	2.2.1 Classification of upscaling methods	28
	2.2.2 Flow: From Stokes to Darcy/Brinkman equations	29
	2.2.3 Transport: From advection-diffusion to advection-dispersion equation	30
2.3	Applicability range of macroscopic models for reactive systems	32
	2.3.1 Diffusion-reaction equations: mixing-induced precipitation processes	32
	2.3.2 Preliminaries	33
	2.3.3 Upscaling via volume averaging	34
	2.3.4 Advection-diffusion-reaction equation	36
2.4	Hybrid models for transport in porous media	38
	2.4.1 Intrusive hybrid algorithm	38
	2.4.2 Taylor dispersion in a fracture with reactive walls	41

2.4.3	Hybrid algorithm	42
2.4.4	Numerical results	43
2.4.5	Non-intrusive hybrid algorithm	44
2.5	Conclusions	48
	References	49
3	A tensorial formulation in four dimensions of thermoporoelastic phenomena (<i>M.C. Suarez Arriaga</i>)	53
3.1	Introduction	53
3.2	Theoretical and experimental background	53
3.3	Model of isothermal poroelasticity	55
3.4	Thermoporoelasticity model	57
3.5	Dynamic poroelastic equations	58
3.6	The finite element method in the solution of the thermoporoelastic equations	58
3.7	Solution of the model for particular cases	58
3.8	Discussion of results	59
3.9	Conclusions	61
	References	62

Section 2: Flow and transport

4	New method for estimation of physical parameters in oil reservoirs by using tracer test flow models in Laplace space (<i>J. Ramirez-Sabag, O.C. Valdiviezo-Mijangos & M. Coronado</i>)	65
4.1	Introduction	65
4.2	Numerical laplace transformation of sample data	65
4.3	The laplace domain optimization procedure	68
4.4	The real domain optimization procedure	68
4.5	The optimization method	68
4.6	The validation procedure	69
4.6.1	Employed mathematical models	69
4.6.2	Generation of synthetic data	70
4.6.3	Result with synthetic data	70
4.7	Reservoir data cases	73
4.7.1	A homogeneous reservoir (Loma Alta Sur)	73
4.7.2	A fractured reservoir (Wairakei field)	74
4.8	Summary and concluding remarks	76
	References	76
5	Dynamic porosity and permeability modification due to microbial growth using a coupled flow and transport model in porous media (<i>M.A. Díaz-Viera & A. Moctezuma-Berthier</i>)	79
5.1	Introduction	79
5.2	The flow and transport model	80
5.2.1	Conceptual model	80
5.2.2	Mathematical model	81
5.2.3	Numerical model	84
5.2.4	Computational model	85
5.3	Numerical simulations	85
5.3.1	Reference study case description: a waterflooding test in a core	85
5.3.2	Modeling of secondary recovery by water injection	86

5.3.3	Modeling of enhanced recovery by water injection with microorganisms and nutrients	88
5.3.4	Porosity and permeability modification due to microbial activity	90
5.4	Final remarks	92
	References	95
6	Inter-well tracer test models for underground formations having conductive faults: development of a numerical model and comparison against analytical models (<i>M. Coronado, J. Ramírez-Sabag & O. Valdiviezo-Mijangos</i>)	97
6.1	Introduction	97
6.2	Description of the analytical models	98
6.2.1	The closed fault model	99
6.2.2	The open fault model	101
6.3	The numerical model	103
6.4	Numerical results	106
6.5	Comparison of the analytical models against numerical simulations	107
6.5.1	Injection-dominated flow case	108
6.5.2	Fault-dominated flow case	108
6.5.3	Closed fault case	109
6.6	Summary and final conclusions	110
	References	111
7	Volume average transport equations for in-situ combustion (<i>A.G. Vital-Ocampo & O. Cazarez-Candia</i>)	113
7.1	Introduction	113
7.2	Study system	114
7.2.1	Local mass, momentum and energy equations	115
7.2.2	Jump conditions	115
7.3	Average volume	117
7.4	Average equations	118
7.5	Physical model	120
7.6	Equations for in-situ combustion	121
7.7	Numerical solution	126
7.8	Solution	126
7.9	Results	128
7.10	Conclusions	130
7.A	Appendix	131
7.A.1	Oil vaporization	131
	References	131
8	Biphasic isothermal tricomponent model to simulate advection-diffusion in 2D porous media (<i>A. Moctezuma-Berthier</i>)	133
8.1	Introduction	133
8.2	Model description	133
8.2.1	General considerations	133
8.2.2	Mathematical model	134
8.2.3	Numerical model	139
8.2.4	Solution of the system	144
8.2.5	Management of the partials derivatives	148
8.2.6	Solution scheme	159
8.2.7	Treating the boundary conditions	163
8.2.8	Initial conditions for the fluid flow and the tracer systems	168

8.3	Validation of biphasic flow system	169
8.4	Conclusions	170
	References	170

Section 3: Statistical and stochastic characterization

9	A 3D geostatistical model of Upper Jurassic Kimmeridgian facies distribution in Cantarell oil field, Mexico (<i>R. Casar-González, M.A. Díaz-Viera, G. Murillo-Muñetón, L. Velasquillo-Martínez, J. García-Hernández & E. Aguirre-Cerda</i>)	173
9.1	Introduction	173
9.2	Methodological aspects of geological and petrophysical modeling	175
9.2.1	The geological model	175
9.2.2	The petrophysical model	177
9.3	Conceptual geological model	177
9.3.1	Geological setting	177
9.3.2	Sedimentary model and stratigraphic framework	177
9.3.3	The conceptual geological model definition	179
9.3.4	Analysis of the structural sections	180
9.3.5	Description of the stratigraphic correlation sections	181
9.3.6	Lithofacies definition	181
9.4	Geostatistical modeling	183
9.4.1	Zone partition	183
9.4.2	Stratigraphic grid definition	183
9.4.3	CA facies classification	184
9.4.4	Facies upscaling process	184
9.4.5	Statistical analysis	184
9.4.6	Geostatistical simulations	189
9.5	Conclusions	193
	References	193
10	Trivariate nonparametric dependence modeling of petrophysical properties (<i>A. Erdely, M.A. Díaz-Viera & V. Hernández-Maldonado</i>)	195
10.1	Introduction	195
10.1.1	The problem of modeling the complex dependence pattern between porosity and permeability in carbonate formations	195
10.1.2	Trivariate copula and random variables dependence	196
10.2	Trivariate data modeling	197
10.3	Nonparametric regression	198
10.4	Conclusions	202
	References	203
11	Joint porosity-permeability stochastic simulation by non-parametric copulas (<i>V. Hernández-Maldonado, M.A. Díaz-Viera & A. Erdely-Ruiz</i>)	205
11.1	Introduction	205
11.2	Non-conditional stochastic simulation methodology by using Bernstein copulas	205
11.3	Application of the methodology to perform a non-conditional simulation with simulated annealing using bivariate Bernstein copulas	206
11.3.1	Modeling the petrophysical properties dependence pattern, using non-parametric copulas or Bernstein copulas	207

11.3.2	Generating the seed or initial configuration for simulated annealing method, using the non-parametric simulation algorithm	208
11.3.3	Defining the objective function	210
11.3.4	Measuring the energy of the seed, according to the objective function	210
11.3.5	Calculating the initial temperature, and the most suitable annealing schedule of simulated annealing method to carry out the simulation	211
11.3.6	Performing the simulation	213
11.3.7	Application of the methodology for stochastic simulation by bivariate Bernstein copulas to simulate a permeability (K) profile. A case of study	215
11.4	Comparison of results using three different methods	218
11.4.1	A single non-conditional simulation, and a median of 10 non-conditional simulations of permeability	219
11.4.2	A single 10% conditional simulation, and a median of 10, 10% conditional simulations of permeability	221
11.4.3	A single 50% conditional simulation, and a median of 10, 50% conditional simulations of permeability	224
11.4.4	A single 90% conditional simulation, and a median of 10, 90% conditional simulations of permeability	226
11.5	Conclusions	227
	References	229
12	Stochastic simulation of a vuggy carbonate porous media (<i>R. Casar-González & V. Suro-Pérez</i>)	231
12.1	Introduction	231
12.2	X-ray computed tomography (CT)	231
12.3	Exploratory data analysis of X-Ray computed tomography	233
12.4	Transformation of the information from porosity values to indicator variable	233
12.5	Spatial correlation modeling of the porous media	235
12.6	Stochastic simulation of a vuggy carbonate porous media	237
12.7	Simulation annealing multipoint of a vuggy carbonate porous media	238
12.8	Simulation of continuous values of porosity in a vuggy carbonate porous medium	240
12.9	Assigning permeability values based on porosity values	242
12.10	Application example: effective permeability scaling procedure in vuggy carbonate porous media	244
12.11	Scaling effective permeability with average power technique	246
12.12	Scaling effective permeability with percolation model	246
12.13	Conclusions and remarks	248
	References	248
13	Stochastic modeling of spatial grain distribution in rock samples from terrigenous formations using the plurigaussian simulation method (<i>J. Méndez-Venegas & M.A. Díaz-Viera</i>)	251
13.1	Introduction	251
13.2	Methodology	251
13.2.1	Data image processing	252
13.2.2	Geostatistical analysis	252
13.3	Description of the data	256

13.4	Geostatistical analysis	259
	13.4.1 Exploratory data analysis	259
	13.4.2 Variographic analysis	259
13.5	Results	259
13.6	Conclusions	264
	References	266
14	Metadistances in prime numbers applied to integral equations and some examples of their possible use in porous media problems (<i>A. Ortiz-Tapia</i>)	267
14.1	Introduction	267
	14.1.1 Some reasons for choosing integral equation formulations	267
	14.1.2 Discretization of an integral equation with regular grids	267
	14.1.3 Solving an integral equation with MC or LDS	268
14.2	Algorithms description	269
	14.2.1 Low discrepancy sequences	269
	14.2.2 Halton LDSs	269
	14.2.3 What is a “metadistance”	270
	14.2.4 Refinement of mds	271
14.3	Numerical experiments	271
	14.3.1 Fredholm equations of the second kind in one integrable dimension	271
	14.3.2 Results in one dimension	272
	14.3.3 Choosing a problem in two dimensions	273
	14.3.4 Transformation of the original problem	275
	14.3.5 General numerical algorithm	277
	14.3.6 MC results, empirical rescaling	278
	14.3.7 Halton results, empirical rescaling	278
	14.3.8 MDs results, empirical rescaling	280
	14.3.9 MC results, systematic rescaling	282
	14.3.10 Halton results, systematic rescaling	282
	14.3.11 MDs results, systematic rescaling	282
	14.3.12 Accuracy goals	282
	14.3.13 Rate of convergence	284
14.4	Conclusions	284
	References	284

Section 4: Waves

15	On the physical meaning of slow shear waves within the viscosity-extended Biot framework (<i>T.M. Müller & P.N. Sahay</i>)	289
15.1	Introduction	289
15.2	Review of the viscosity-extended biot framework	290
	15.2.1 Constitutive relations, complex phase velocities, and characteristic frequencies	290
	15.2.2 Properties of the slow shear wave	292
15.3	Conversion scattering in randomly inhomogeneous media	292
	15.3.1 Effective wave number approach	292
	15.3.2 Attenuation and dispersion due to conversion scattering in the slow shear wave	294

15.4	Physical interpretation of the slow shear wave conversion scattering process	295
15.4.1	Slow shear conversion mechanism as a proxy for attenuation due to vorticity diffusion within the viscous boundary layer	295
15.4.2	The slow shear wave conversion mechanism versus the dynamic permeability concept	297
15.5	Conclusions	298
15.A	Appendix	299
15.A.1	α and β matrices	299
15.A.2	Inertial regime	300
	References	301
16	Coupled porosity and saturation waves in porous media (<i>N. Udey</i>)	303
16.1	Introduction	303
16.2	The governing equations	303
16.2.1	Variables and definitions	303
16.2.2	The equations of continuity	304
16.2.3	The equations of motion	305
16.2.4	The porosity and saturation equations	306
16.3	Dilatational waves	306
16.3.1	The Helmholtz decomposition	306
16.3.2	The dilatational wave equations	307
16.3.3	The dilatational wave operator matrix equation	309
16.3.4	Wave operator trial solutions	311
16.4	Porosity waves	313
16.4.1	The porosity wave equation	313
16.4.2	The dispersion relation	315
16.4.3	Comparison with pressure diffusion	315
16.5	Saturation waves	316
16.5.1	The wave equations	316
16.5.2	The dispersion relation	317
16.6	Coupled porosity and saturation waves	319
16.6.1	The dispersion relation	319
16.6.2	Factorization of the dispersion relation	321
16.7	A numerical illustration	324
16.7.1	The porosity wave	324
16.7.2	The saturation wave	327
16.8	Conclusion	331
	References	332
	Subject index	335
	Book series page	339
