PLANETS
AND OTHERS
From Earth to Exoplanets

Foreword xi
Introduction xiii

1. How to Explore Planets? 1
   1.1 The Earth in space 1
   1.2 Telescopic observations 3
   1.3 Observations from space 7
   1.4 Searching for exoplanets 15

2. The Birth of Planets 21
   2.1 A formation within a disk 21
   2.2 A common scenario in the Universe 22
   2.3 What is the age of the solar system? 26
   2.4 The main steps of planetary formation 29
   2.5 Telluric planets and giant planets 31
   2.6 Between the two families of planets: asteroids 33
   2.7 Pluto and the transneptunian objects 35
3. Exploring Planet Earth
   3.1 Rocks and metals: a differentiated internal structure
   3.2 A terrestrial singularity: plate tectonics
   3.3 Formation of terrestrial relief: the isostasy principle
   3.4 Our natural environment: the terrestrial atmosphere
   3.5 The water cycle: another specificity of Earth
   3.6 Between the Earth and space, the magnetosphere
   3.7 A brief history of the Earth’s climate
   3.8 The Earth–Moon couple: a double system
   3.9 The Earth, a unique planet...

4. The Neighbors of the Earth
   4.1 Closest to the Sun, Mercury
   4.2 A Moon that looks like Mercury
   4.3 Venus, the furnace
   4.4 Mars, a desert word
   4.5 Comparative evolution of terrestrial planets: the role of water

5. A Little Further, the Giant Planets
   5.1 Two classes of giant planets
   5.2 From Jupiter to Neptune: four decades of exploration
   5.3 The outer satellites

6. Exoplanets, the New Worlds
   6.1 A long quest marked with failures
   6.2 Fifteen years later, the situation
   6.3 The formation of planetary systems
   6.4 How to classify exoplanets?
   6.5 From detection to characterization

7. Searching for Habitable Worlds
   7.1 A new discipline, astrobiology
   7.2 Life elsewhere in the solar system?
   7.3 Life on exoplanets?
   7.4 Searching for inhabited worlds
