

Paul C. Bressloff

Stochastic Processes in Cell Biology

 Springer

Contents

1	Introduction	1
1.1	Stochastic Processes in Living Cells	1
1.1.1	Internal and External States of a Macromolecule	2
1.1.2	Equilibrium and Nonequilibrium Systems	5
1.1.3	Populations of Molecules	6
1.1.4	Self-Organization	8
1.2	Experimental Studies of Noise in Cells	11
1.2.1	FRAP and Single-Particle Tracking	11
1.2.2	Optical Tweezers or Traps	13
1.2.3	Two-Reporter Assays	15
1.2.4	Fluorescent Imaging	16
1.3	A Brief Introduction to Probability Theory	16
1.3.1	Random Variables	17
1.3.2	Conditional Probabilities and Correlations	18
1.3.3	Adding Random Variables	20
1.3.4	Transformation of Random Variables	21
1.3.5	Moments and Cumulants	21
1.3.6	Stochastic Processes	22
1.4	Statistical Mechanics and the Boltzmann–Gibbs Distribution	23
1.4.1	Boltzmann–Gibbs Distribution	23
1.4.2	Free Energy and Entropy	24
1.4.3	Chemical Potential of a Solution	25
1.5	Organization of the Book	27
1.5.1	How to Use the Book	28

Part I Foundations

2	Diffusion in Cells: Random Walks and Brownian Motion	35
2.1	Discrete-Time Random Walk	36
2.1.1	Continuum Limit of a Random Walk	45

2.2	Continuous Stochastic Processes and the Fokker–Planck (FP) Equation	48
2.2.1	Derivation of the FP Equation from a Langevin Equation	49
2.2.2	Boundary Conditions for the FP Equation	54
2.2.3	The Ornstein–Uhlenbeck Process	55
2.2.4	Multiplicative Noise	57
2.2.5	Correlations and the Power Spectrum	58
2.3	First Passage Time Density and the Backward FP Equation	61
2.4	Diffusion-Limited Reaction Rates	65
2.4.1	Smoluchowski Reaction Rate	65
2.4.2	Chemoreception	68
2.5	Boundary Value Problems	70
2.5.1	Eigenfunction Expansions	70
2.5.2	Green’s Functions and Steady-State Analysis	73
2.6	Appendix: An Informal Introduction to Stochastic Calculus	77
2.6.1	What Is a Continuous Stochastic Process?	78
2.6.2	Ito Stochastic Integrals	80
2.6.3	Ito’s Formula and the Fokker–Planck Equation	85
2.6.4	Multiplicative Noise and Stratonovich Integrals	86
2.6.5	Ito Integration and Convergence	87
2.6.6	Simulation of Stochastic Differential Equations	88
2.6.7	Milstein’s Method	90
2.6.8	Runge–Kutter and Implicit Methods	92
2.7	Exercises	93
3	Stochastic Ion Channels	103
3.1	Single Ion Channel Kinetics	104
3.1.1	Voltage-Gated Ion Channels	104
3.1.2	Ligand-Gated Ion Channel	108
3.1.3	Monod–Wyman–Changeux Model	110
3.2	Master Equation for an Ensemble of Ion Channels	112
3.2.1	Diffusion Approximation of a Birth–Death Master Equation	115
3.3	Population Channel Bistability and Mean Escape Times	118
3.4	Stochastic Models of Ca^{2+} Release	122
3.4.1	Stochastic Model of Ca^{2+} Puffs in a Cluster of IP_3Rs	124
3.4.2	Stochastic Model of Ca^{2+} Sparks in Cardiac Myocytes	128
3.5	Membrane Voltage Fluctuations and Spontaneous Action Potentials	134
3.5.1	Conductance-Based Model of Neural Excitability	134
3.5.2	Neural Excitability and Phase-Plane Analysis	138
3.5.3	Stochastic Conductance-Based Model	142
3.6	Stochastic Gating Model of Confinement	147
3.7	Exercises	151

4	Polymers and Molecular Motors	159
4.1	Polymerization	165
4.1.1	Simple Model of a Single Polymer Filament	165
4.1.2	Microtubule Catastrophes	169
4.2	Brownian Motion in a Periodic Potential	176
4.2.1	Polymerization Ratchet	179
4.2.2	Translocation Ratchet	181
4.3	Brownian Ratchet Model of a Processive Molecular Motor	183
4.4	Collective Effects of Multiple Molecular Motors	190
4.4.1	Intracellular Cargo Transport by Multiple Motors	190
4.4.2	Tug-of-War Model	193
4.4.3	Collective Extraction of Membrane Nanotubes	197
4.4.4	Rigidly Linked Molecular Motors	208
4.5	Appendix: Statistical Mechanics of Polymers	212
4.6	Exercises	218
5	Sensing the Environment: Adaptation and Amplification in Cells	227
5.1	Physical Limits of Biochemical Signaling due to Noise	228
5.2	Fluctuation–Dissipation Theorem	231
5.3	Bacterial Chemotaxis	237
5.3.1	Receptor Clustering and Signal Amplification	241
5.3.2	Adaptation in Signal Transduction Pathways	245
5.3.3	Bacterial Chemotaxis as a Velocity-Jump Process	246
5.4	Hair Cells and Active Mechanotransduction	251
5.4.1	Gating-Spring Model	254
5.4.2	Channel Compliance, Myosin Motors and Spontaneous Oscillations	256
5.4.3	Active Amplification Close to a Hopf Bifurcation	260
5.5	Exercises	262
6	Stochastic Gene Expression and Regulatory Networks	269
6.1	Basics of Gene Expression	270
6.1.1	Intrinsic Versus Extrinsic Noise Sources	272
6.1.2	Biological Significance of Stochasticity	273
6.2	Unregulated Transcription and Translation	274
6.2.1	Translational Bursting	275
6.3	Simple Models of Gene Regulation	278
6.3.1	Transcriptional Bursting in a Two-State Model	279
6.3.2	Protein Fluctuations and the Linear Noise Approximation	282
6.3.3	Autoregulatory Network	288
6.4	Genetic Switches and Oscillators	290
6.4.1	Mutual Repressor Model of a Genetic Switch	290
6.4.2	The <i>lac</i> Operon	295
6.4.3	Genetic Oscillator Network	298
6.4.4	The Circadian Clock and Molecular Noise	299
6.4.5	Quasi-Cycles in a Biochemical Oscillator	304

6.5	Information Transmission in Regulatory Networks	308
6.5.1	Entropy and Mutual Information	310
6.5.2	Optimizing Mutual Information in a Simple Regulatory Network	313
6.6	Fluctuations in DNA Transcription	317
6.7	Kinetic Proofreading	322
6.7.1	Kinetic Proofreading in Protein Synthesis	325
6.7.2	Kinetic Proofreading in T-Cell Activation	327
6.8	Stochastic Algorithms for Chemical Kinetics	329
6.8.1	The Stochastic Simulation Algorithm	329
6.8.2	Tau-Leaping	330
6.9	Exercises	331

Part II Advanced Topics

7	Transport Processes in Cells	343
7.1	Anomalous Diffusion	347
7.1.1	Molecular Crowding, Diffusion-Trapping, and Long-Time Correlations	347
7.1.2	Diffusion–Trapping Model of Protein Trafficking in Dendrites	350
7.1.3	Continuous-Time Random Walks	355
7.1.4	Diffusion in the Plasma Membrane	359
7.2	Narrow Escape Problems, Small Targets, and Singular Perturbation Methods	361
7.2.1	Narrow Escape Problems	361
7.2.2	Diffusion to a Small Target	365
7.3	Membrane Transport Through Nanopores and Channels	368
7.3.1	Confined Diffusion and the Fick–Jacobs Equation	370
7.3.2	Nuclear Transport	373
7.3.3	Single-File Diffusion	379
7.3.4	Translocation of DNA Through a Nanopore	383
7.4	PDE Models of Active Transport	385
7.4.1	Active Transport on a 1D Track	386
7.4.2	Active Transport on Microtubular Networks	390
7.5	Exclusion Processes	396
7.5.1	Asymmetric Exclusion Process and the Hydrodynamic Limit	397
7.5.2	Steady-State Analysis	399
7.5.3	Method of Characteristics and Shocks	401
7.6	Random Intermittent Search Processes	407
7.6.1	Diffusive Search for a Protein-DNA Binding Site	408
7.6.2	Optimal Unbiased Search on a 1D Track	415
7.6.3	Biased Intermittent Search	419
7.6.4	Effects of Local Chemical Signaling	422
7.6.5	Virus Trafficking	426
7.7	Exercises	428

8	Self-Organization in Cells I: Active Processes	439
8.1	Cellular Length Regulation by Molecular Motors	440
8.1.1	Filament Length Regulation by Depolymerization	441
8.1.2	Filament Length Regulation by Altering the Frequency of Catastrophes	445
8.1.3	Length Regulation by Intraflagellar Transport	446
8.2	Cell Mitosis	447
8.2.1	Search-and-Capture Model of Chromosome/Kinetochores Attachment	450
8.2.2	Chromosome Movements and Directional Instability	455
8.2.3	Force Balance and Spindle Length Control	467
8.3	Cell Motility	473
8.3.1	Tethered Ratchet Model	474
8.3.2	Crawling Cells and Lamellipodial Motility	478
8.3.3	Stochastic Model of Integrin-Mediated Cell Protrusion	480
8.4	Cooperative Transport of Proteins Between Cellular Organelles	483
8.5	Exercises	489
9	Self-Organization in Cells II: Reaction-Diffusion Models	497
9.1	Intracellular Protein Concentration Gradients	498
9.1.1	Spatially Distributed Signaling Cascades	500
9.1.2	Robustness of Concentration Gradients	504
9.2	Theory of Turing Pattern Formation	509
9.2.1	Linear Stability Analysis	510
9.2.2	Amplitude Equations and Bifurcation Theory	513
9.3	Stochastic Pattern Formation and the RD Master Equation	524
9.3.1	Turing Instability in the Brusselator Model	525
9.3.2	Linear-Noise Approximation of RD Master Equation	526
9.4	Protein Self-Organization of Min Proteins in <i>E. coli</i>	531
9.5	Cell Polarization	537
9.5.1	Positive Feedback Model: Deterministic Analysis	543
9.5.2	Positive Feedback Model: Stochastic Analysis	548
9.5.3	Active Transport Models	554
9.5.4	Turing-Like Mechanism for Cell Polarization	560
9.5.5	Wave-Pinning and Cell Polarity in a Bistable Reaction-Diffusion Model	562
9.6	Exercises	567
10	The WKB Method, Path-Integrals, and Large Deviations	577
10.1	The Wentzel-Kramers-Brillouin Method	579
10.1.1	WKB Method for a Birth-Death Master Equation	579
10.1.2	WKB Method for a Stochastic Hybrid System	587
10.1.3	Stochastic Ion Channels Revisited	591
10.2	Path Integral Representation of an SDE	593
10.2.1	The WKB Method and First Passage Time Problems in the Weak Noise Limit	596

10.3	Path-Integral Representation of a Birth–Death Master Equation	599
10.4	Path-Integral Representation of a Stochastic Hybrid System	604
10.5	Excitability in the Stochastic Morris–Lecar Model	608
10.6	Exercises	614
11	Probability Theory and Martingales	619
11.1	Probability Spaces, Random Variables and Conditional Expectations	619
11.2	Definitions and Examples of Martingales	621
11.3	Stopping Times	624
11.4	Martingale Convergence Theorems	626
11.5	The Galton–Watson Branching Process	627
11.5.1	Generating Functions and Basic Properties	628
11.5.2	Extinction and Criticality	629
11.5.3	Asymptotic Properties	631
11.5.4	Application to Gene Amplification and Drug Resistance	633
11.6	Modeling Chemical Reaction Networks as Counting Processes	634
11.6.1	Poisson Processes and Counting Processes	635
11.6.2	Chemical Reactions and Counting Processes	640
	References	645
