Contents

1 Motivation 1

2 State of the art and research 3

2.1 Bearing capacity of tubular steel piles . . . 3

2.1.1 Installation of tubular steel piles . . . 5

2.1.2 Time-dependent change of the bearing capacity of tubular steel piles 10

2.1.3 Investigations on pile bearing capacity . . . 10

2.1.4 Discussion of existing research . . . 16

2.2 Pile load tests . . . 17

2.2.1 Static load test . . . 19

2.2.2 Rapid load test . . . 19

2.2.3 Dynamic load test . . . 21

2.2.4 Investigations on pile load tests . . . 26

2.2.5 Discussion of existing research . . . 27

3 Aim of research and methodology 29

3.1 Methodology for the performed research work . . . 30

3.2 Structure of the thesis . . . 31

4 Numerical modeling 33

4.1 Numerical modeling of dynamic load tests . . . 33

4.1.1 Discretization method . . . 33

4.1.2 Selection of a discretization method . . . 36

4.1.3 Constitutive models for sand . . . 36

4.1.4 Material parameter identification for very fine silica sand . . . 41

4.1.5 Modeling of pile-soil interaction . . . 42

4.1.6 Derived numerical model for dynamic load tests . . . 43

4.2 Mathematical optimization as an inverse technique . . . 44

5 Centrifuge tests 49

5.1 Scaling laws . . . 49

5.2 Outline of testing . . . 51

5.3 Soil sample and pore fluid . . . 52

5.4 Testing arrangement . . . 55

5.5 Testing procedure . . . 57

5.6 Pile instrumentation . . . 58

5.7 Results of centrifuge tests . . . 60

5.7.1 Results of static load tests . . . 60

5.7.2 Results of dynamic load tests 62

6 Numerical modeling of the pile response due to dynamic impact 67
6.1 Influencing variables for dynamic load tests 67
6.1.1 Research method to determine influencing variables 67
6.1.2 Influence of pile-soil interaction 69
6.1.3 Influence of pore water and drainage condition of the soil 74
6.1.4 Influence of relative density 78
6.1.5 Influence of pile horizontal oscillations 79
6.1.6 Influence of pile type 82
6.1.7 Influence of pile installation 84
6.1.8 Comparison of static and dynamic load tests 87
6.1.9 Summary of influencing variables for dynamic load tests 91
6.2 Sensitivity analysis of numerical modeling of dynamic load tests 92
6.2.1 Numerical modeling of a dynamic load test 92
6.2.2 Validation of the numerical model 94
6.2.3 Sensitivity of unknown system parameters for dynamic load tests . 95
6.2.4 Deriving a process oriented model for dynamic load tests 100

7 Identification of the pile-soil interaction from the system response 103
7.1 Multiobjective evolutionary algorithm for the identification of the pile-soil interaction 104
7.2 Application of the approach to identify the pile-soil interaction 106
7.2.1 Application of the approach to closed-ended piles 108
7.2.2 Application of the approach to open-ended piles 110

8 Validation of the identification of the pile-soil interaction and pile bearing capacity 113
8.1 Validation of the identification of the pile-soil interaction 113
8.1.1 Negligence of the pile installation for the identification of the pile-soil interaction 113
8.1.2 Consideration of the pile installation for the identification of the pile-soil interaction 116
8.2 Determination of the pile bearing capacity 122
8.2.1 Neglecting the pile installation for the evaluation technique 123
8.2.2 Consideration of the pile installation as part of the evaluation technique 124
8.3 Applicability 124

9 Conclusion 127

Bibliography 131

APPENDIX **147**

A Notation **147**
A.1 Abbreviations 147
A.2 Physical parameters 147

B Laboratory tests on very fine silica sand **157**

C Material parameters **159**

D Results of the performance of the FE-based evaluation method **163**
