A BALKEMA BOOK

Table of Contents

<i>Author Biography</i>	XI
<i>Acknowledgements</i>	XIII
<i>List of Symbols</i>	XV
Chapter 1: Waste Engineering, Characteristics of Mine Wastes and Types of Waste Storage	1
1.1 The nature and magnitude of the mine waste storage activity	1
1.2 Origins and quantities of mine waste	2
1.3 The effects of climate	5
1.4 Waste characteristics	7
1.5 Principles of mine waste management	8
1.6 Types of mine waste storage	12
1.7 Philosophy and arrangement of this book	19
Chapter 2: Selection of a Site for Storage of Mine Waste	25
2.1 Procedure for site selection	25
2.2 Preliminary assessment of required size of site	26
2.3 Possible fatal flaws in candidate sites	27
2.4 Seeking and obtaining public acceptance	28
2.5 Preliminary ranking of candidate sites	30
2.6 Site feasibility study	30
2.7 Risk analysis	31
2.8 Environmental impact report	36
2.9 Preliminary geotechnical characterization of waste	40
2.10 Preliminary site investigation	41
2.11 Final site selection	47
2.12 Examples of disastrous selection of sites	47

Chapter 3: Geotechnical Exploration of Sites for Development of Mine Waste Storages	49
3.1 Soil engineering survey	49
3.2 Soil engineering data	49
3.3 Detailed information for design of slopes & seepage control	50
3.4 Profile description	51
3.5 Simple in situ tests and soil sampling	57
3.6 Taking undisturbed soil samples for laboratory testing	61
Chapter 4: Environmental and Engineering Characteristics of Mine Waste, Including Stress and Strain Analysis and Laboratory Shear Testing	67
4.1 Characteristics having environmental impact	67
4.2 Engineering characteristics	68
4.3 Changes of waste characteristics with time, and other considerations	70
4.4 Analysis of stresses and strains and the principle of effective stress	73
4.5 The behaviour of mine waste materials subjected to shear	86
4.6 The process of consolidation and pore pressure re-distribution in laboratory shear tests	121
4.7 The strength and viscosity of tailings at large water contents	129
4.8 The shear strengths of interfaces	134
4.9 The shear strength of waste rock	139
4.10 Strain softening of “dry” coarse mine wastes	141
4.11 The mechanics of unsaturated waste materials	142
Chapter 5: In Situ Shear Strength Testing of Tailings and Other Waste Materials and its Interpretation	149
5.1 The shear vane test	150
5.2 The pressuremeter test	160
5.3 The cone penetrometer test	164
5.4 Estimation of potential for liquefaction from cone penetration tests	183
Chapter 6: Measuring the Coefficient of Permeability in the Laboratory and In Situ, Seepage Flow Nets, Drains and Linings, Geosynthetics, Geomembranes and GCL's	191
6.1 Measuring permeability	191
6.2 Observed differences between small scale and large scale permeability measurements	192
6.3 Laboratory tests for permeability	194
6.4 Methods for measuring permeability in situ	197
6.5 Estimation of permeability from field tests	205
6.6 Large-scale permeability tests using test pads	208
6.7 The permeability of tailings	208
6.8 Seepage and flow nets	212
6.9 The design of filter drains	220

6.10	Calculation of seepage rates through tailings storages	225
6.11	The processes of consolidation and pore pressure re-distribution	229
6.12	Basal impervious liners and surface cover layers	235
6.13	Blockage of filter drains and geotextiles	242
6.14	Geosynthetic materials	245
Chapter 7: The Mechanics of Compaction		257
7.1	The compaction process	257
7.2	Uses of compaction in mine waste engineering	259
7.3	The mechanisms of compaction	260
7.4	Relationships between saturated permeability to water flow and water content	262
7.5	Laboratory compaction	262
7.6	Precautions to be taken with laboratory compaction	263
7.7	Compaction in the field	267
7.8	Designing a compacted clay layer for permeability	268
7.9	Seepage through field-compacted layers	270
7.10	Control of compaction in the field	271
7.11	Special considerations for work in climates with large rates of evaporation	275
7.12	Additional points for consideration	276
Chapter 8: Methods for Constructing Impounding Dykes for Storing Hydraulically Transported Tailings and Other Fine-Grained Wastes		281
8.1	Deposition methods and sequences	281
8.2	Beach formation in hydraulic deposition of fine-grained wastes	284
8.3	Predicting beach profiles	290
8.4	Details of particle size sorting during hydraulic deposition	295
8.5	Effects of particle size sorting on permeability, water content and strength variation down a beach	299
8.6	A comparison of tailings beaches formed in air and in water	302
8.7	Methods for depositing slurries of tailings and other fine-grained waste materials	308
8.8	Operational systems for tailings storages	322
8.9	An example of building an embankment by underwater deposition	332
8.10	Pool control and decanting	335
Chapter 9: Water Control and Functional and Safety Monitoring for Hydraulic Fill Tailings Storages and Dry Dumps. Safety Appraisal. Special Considerations for Carbonaceous and Radioactive Wastes		339
9.1	Basis of a water control system	339
9.2	Penstocks or decant towers and spillways	341
9.3	Monitoring systems for waste storages	358
9.4	Appraisal of safety for waste storages	365

9.5	Special considerations for carbonaceous wastes	368
9.6	A note on characteristics of radioactive wastes	377
Chapter 10: Water Balances for Tailings Storage Facilities and Dry Waste Dumps		381
10.1	Water balances in general	381
10.2	Required data	383
10.3	Components of the water balance for an operational tailings storage	383
10.4	Examples of water balances for operating hydraulic fill tailings storage impoundments	385
10.5	The possibilities for saving water	392
10.6	Seepage from the tailings storage into the foundation strata and the recession of the phreatic surface following cessation of operations	396
10.7	Drainage of interstitial water as the phreatic surface recedes	397
10.8	The water balance for a “dry” dump or a closed and rehabilitated tailings storage	399
10.9	Measuring potential infiltration and runoff	400
10.10	Estimating evaporation or evapotranspiration	405
10.11	Measuring evaporation by solar energy balance	409
10.12	Depth to which evaporation extends	423
10.13	The effects of slope angle and orientation on solar radiation received by slopes of waste storages	426
10.14	Water balances for “Infiltrate, Store, Evapotranspire” (ISE) covers and for impervious cover layers on mine waste storages	430
10.15	The water balance for a dry ash dump	437
10.16	Disposal of industrial waste liquids by evaporation and capillary storage in waste	439
10.17	The role of soil heat G in evaporation of water from a soil	443
10.18	Further points to consider	447
10.19	Principles of the measuring weir	450
Chapter 11: Failures of Mine Waste Storages		453
11.1	Failures: causes, consequences, characteristics	453
11.2	Failures of hydraulic fill tailings storages caused by seismic events	457
11.3	Flow failures caused by overtopping	459
11.4	Failure caused by increasing pore pressure	473
11.5	Failures caused by excessive rate of rise	475
11.6	Failure caused by poor control of slurry relative density	479
11.7	Post-failure profiles of hydraulic fill tailings storages	482
11.8	Analysis of the motion of flow failures	487
11.9	The effects of failure geometry on insurance rates	489
11.10	Failures of dumps of coarse wastes	490
11.11	Failures caused by collapse of tailings storages into subterranean caverns or underground workings	501
11.12	Failures of impervious linings installed on steep slopes	503

11.13	Methods for analysis of the stability of slopes	507
11.14	Further points regarding the failure of slopes	514
Chapter 12: Surface Stability of Tailings Storages Slopes – Erosion Rates, Slope Geometry and Engineered Erosion Protection		519
12.1	Past practice for slope angles of tailings storages	519
12.2	Acceptable erosion rates for slopes	520
12.3	Wind erosion compared with water erosion	526
12.4	Acceptable slope geometry for tailings storages	526
12.5	Protection of slopes against erosion by geotechnical means	531
12.6	Special considerations applying to badly eroded abandoned or neglected tailings storages	546
12.7	The effect of eroded tailings on the surroundings of a storage of sulphidic tailings	550
12.8	Wind speed profiles, amplification factors and wind erosion	552
12.9	Wind speed profiles over natural and constructed slopes	554
12.10	Wind tunnel tests on model waste storages	558
12.11	Erosion and deposition by wind on full size waste storages	561
12.12	Analysis of particle movement in the wind	566
12.13	Summary of points to be considered	567
Chapter 13: The Use of Mine Waste for Backfilling of Mining Voids and as a Construction Material		571
13.1	Applications of backfilling	571
13.2	Backfilling of shallow underground mine workings to stabilize the surface	577
13.3	The properties of mine waste as a structural underground support in narrow stopes	583
13.4	Measurements in situ of stresses and strains in fills at great depth	596
13.5	Supporting narrow stopes with steel-reinforced granular tailings backfill	598
13.6	The behaviour of steel mesh-reinforced square columns of cemented cyclone tailings underflow (grout packs)	605
13.7	The use of geotextiles for temporary retention of backfill in narrow stopes during hydraulic placing	606
13.8	The use of mine and industrial wastes in surface construction	615
