

Dual sourcing

with arbitrary stochastic demand and stochastic lead times

by
Ulrich Schimpel

Contents

I	Introduction and literature	1
1	Introduction	3
1.1	Research questions	4
1.2	Structure	7
2	Literature review	11
2.1	Replenishment with deterministic lead times	13
2.1.1	Continuously and daily review policies	14
2.1.2	Periodic review policies	18
2.1.3	Optimality of base-stock policies	21
2.2	Replenishment with stochastic lead times	22
2.2.1	Order expediting	27
2.2.2	Order splitting	29
2.3	Related replenishment policies	30
2.4	Summary	33
II	Modeling and practical application	37
3	A model for stochastic dual sourcing (SDMR)	39
3.1	Model description	40

3.1.1	Assumptions	42
3.1.2	Time window for triggering second order	45
3.1.3	Categorization of replenishment cycles	47
3.1.4	Notation conventions	52
3.1.5	Definition of an appropriate probability space	53
3.1.6	Measure of applicability	64
3.2	Probabilities of the reorder cycle scenarios	68
3.2.1	General probabilities of one-order and two-order cycles	68
3.2.2	Detailed probabilities of two-order cycles	70
3.3	Expected shortage of the reorder cycle scenarios	71
3.3.1	One-order cycles	76
3.3.2	Two-order cycles	84
3.4	Expected average cycle stock	100
3.4.1	One-order cycles	101
3.4.2	Two-order cycles	108
3.5	Calculation of derived model parameters	116
3.5.1	Order quantities and cycle demand	117
3.5.2	Service levels	118
3.5.3	Cycle time	119
3.5.4	Average stock per time unit	120
3.5.5	Number of replenishment cycles and orders	120
3.6	Summary	122
4	Considerations for a practical application of the SDMR model	127
4.1	Discretization of the formal model	128
4.1.1	Discretization of continuous distributions	130
4.1.2	Bounds of integration and summation	131
4.1.3	Start of the replenishment cycle	132

4.1.4 Time and demand discretization 134

4.1.5 Time window for second order 135

4.1.6 Compliance with model assumptions 137

4.2 Determining convolution of distributions 139

4.2.1 Analytical determination 140

4.2.2 Limits of an analytical determination 141

4.2.3 Numerical determination 142

4.2.4 Algorithm for a numerical determination 144

4.3 Summary 148

III Evaluation, results, and conclusions 149

5 Overview of the evaluation approach 151

5.1 Comparison of replenishment policies 152

5.2 Employed cost structure 156

5.3 Summary 159

6 Deterministic versus stochastic dual sourcing 161

6.1 Measures of divergence 163

6.1.1 Preliminary observations 164

6.1.2 Ratio of costs 167

6.1.3 Ratio of service levels 169

6.2 Sensitivity analysis on replenishment-relevant parameters 171

6.2.1 Daily demand 171

6.2.2 Lead time of the first supply mode 174

6.2.3 Lead time of the second supply mode 180

6.2.4 Order quantities 185

6.2.5 Reorder points 191

6.2.6	Summary	196
6.3	Case study – a spare parts warehouse	198
6.3.1	Setup for comparing the case study and the sensitivity analysis	200
6.3.2	Capital costs	203
6.3.3	Normal order costs	208
6.3.4	Rush order costs	211
6.3.5	Back order costs	215
6.3.6	Service level	224
6.3.7	Summary	228
6.4	Summary	228
7	Comparison of stochastic replenishment policies	233
7.1	Overview of stochastic replenishment scenarios	234
7.2	Total savings of different replenishment scenarios	235
7.3	Savings induced by relaxed replenishment restrictions	237
7.3.1	Negative reorder point	238
7.3.2	Using emergency orders as normal orders	241
7.3.3	Summary	244
7.4	Savings induced by dual sourcing	246
7.4.1	Small difference between the lead times	247
7.4.2	Increasing difference between the lead times	249
7.4.3	Summary	253
7.5	Summary	254
8	Summary and outlook	257
8.1	Contributions to the research area	257
8.2	Critical review	262
8.3	Outlook	265

IV Appendices	267
A Explanations regarding the used probability space	269
A.1 Example of a discrete random variable and its σ -algebra	269
A.2 Expected value for a continuous random variable	271
A.3 Sum of expected values using indicator functions	272
A.4 Expected value using an indicator function and adding a scalar	275
A.5 Expected value using an indicator function and multiplying a scalar	275
A.6 Conditional expectations for multiple random variables	276
A.7 Time window for triggering a second order	283
A.8 Conditional expected time until stock depletion	284
B Shortage formulas	287
C Stock formulas	291
C.1 One-order cycles	291
C.2 Two-order cycles where the first order arrives first	293
C.3 Two-order cycles where the second order arrives first	296
C.4 Two-order cycles where both orders arrive simultaneously	300
C.4.1 Case 5	300
C.4.2 Case 8	302
D Formulas for dual sourcing with lost sales	305
D.1 Adjusted probability space for the reorder point scenarios	306
D.2 Definition of additional random variables and event sets	308
D.3 Probabilities of the reorder cycle scenarios	311
D.3.1 All reorder points are non-negative	312
D.3.2 At least one reorder point is negative	313
D.4 Expected number of direct shipments	314

D.4.1 All reorder points are non-negative 315

D.4.2 At least one reorder point is negative 319

D.5 Expected average cycle stock 319

D.5.1 Both reorder points are non-negative 320

D.5.2 At least one reorder point is negative 326
