

Thema

Modelling and Solution Paradigms
of Optimization and Planning Problems
for the Semantic Web

Dissertation

zur Erlangung des akademischen Grades eines
doctor rerum politicarum
(Dr. rer. pol.)

vorgelegt dem
Rat der Wirtschaftswissenschaftlichen Fakultät
der Friedrich-Schiller-Universität Jena

am 16.10.2013

von: Dipl.-Wirtschaftsinformatiker (Univ.) Thomas Fischer

geboren am: 05.05.1984 in: Pößneck

Contents

1	Introduction	1
1.1	The Semantic Web	2
1.2	Optimization and Planning	3
1.3	Problem Statement	6
1.4	Contribution	14
1.5	Thesis Outline	18
I	Preliminaries	19
2	Knowledge Representation and Reasoning	21
2.1	Knowledge Representation	21
2.1.1	What is a Knowledge Representation?	22
2.1.2	Deductive Reasoning	23
2.2	Knowledge Representation in the Semantic Web	24
2.2.1	Resource Description Framework	25
2.2.2	RDF Vocabulary Description Language	27
2.2.3	Web Ontology Language	28
2.2.4	Query Languages	32
3	Logical Foundations	37
3.1	Propositional Logic	38
3.1.1	Syntax and Semantics	38
3.1.2	The Davis-Putnam-Logemann-Loveland Procedure	39
3.2	First-Order Logic	46
3.2.1	Syntax	46
3.2.2	Semantics	47
3.2.3	Undecidability of First-Order Logic	48
3.3	Satisfiability Modulo Theories	48
3.3.1	Integrating DPLL+ with Theory Solvers	50
3.3.2	The SMTLIB Language	59
3.4	Description Logics	64
3.4.1	Abstract Syntax and Semantics	65

3.4.2 OWL’s Relationship to Description Logics	69
3.4.3 Reasoning Services	71
3.4.4 Rules	73
3.4.5 Conjunctive Queries	74
II Theoretical Contribution	75
4 The Logical Mathematical Programming Service	77
4.1 The Logical Mathematical Programming Query Language	78
4.1.1 Syntax	78
4.1.2 Semantics	83
4.2 System Architecture	92
4.2.1 Workflow of the Web Service	92
4.2.2 LOMPQL/IP Compiler	94
4.2.3 LOMPQL/SMT Compiler	100
4.3 Related Work	103
4.3.1 Algebraic Modelling	104
4.3.2 AI Planning	105
4.4 Summary	109
III Evaluation	111
5 Modelling and Solution of Knapsack Problems	113
5.1 Classical Knapsack Problem	114
5.1.1 Model Formulation	114
5.1.2 Computational Experiments	115
5.2 Modelling of Generalisations	118
5.2.1 Multidimensional Resource Consumptions	118
5.2.2 Multiple Knapsacks	120
5.3 Multiple Choice Knapsack Problem with Multiple Dimensions	122
5.3.1 Model Formulation	122
5.3.2 Computational Experiments	124
5.4 Discussion	127
6 Relational Knapsack Problems	129
6.1 Scenario - Intelligent Shopping Decisions	130
6.1.1 Knowledge Representation	130
6.1.2 LOMPQL Query	132
6.1.3 Scenario Result	133
6.2 Scenario - Home Energy Optimization	136
6.2.1 Knowledge Representation	137

6.2.2 LOMPQL Query	141
6.2.3 Scenario Results	142
6.3 Summary	143
7 Assembly Line Balancing in Cyber-Physical Production Systems	145
7.1 Related Work on Assembly Line Balancing	147
7.2 Problem Description	148
7.3 Knowledge Representation	150
7.4 Logical Mathematical Programming Query	155
7.4.1 Objective Function	158
7.4.2 Resource Restriction	159
7.4.3 Assignment Restriction	161
7.4.4 Precedence Constraints	162
7.4.5 Linked Task Restriction	166
7.4.6 Incompatible Task Restriction	167
7.5 Result Compilation	167
7.6 Computational Experiments - Exact Solution	168
7.7 Dynamic Sliding Frame Planning	182
7.8 Computational Experiments - Heuristic Solution	189
7.9 Discussion	196
8 Conclusions and Future Work	197
IV Appendices	223
A Ontology Representation for Machines	225
B Example Details	243
C Language Implementation	249
