Introduction xi
The methodology of economics xv

Part 1: Market analysis for the property analyst

1 Applied property market analysis: the theory of demand and supply
   The essentials of the market system 3
   Applied demand theory 5
   Applied supply theory 15
   The formation of market equilibrium 20
   The impact of changing market conditions 21
   Conclusion 22

2 Measured market analysis – the concept of elasticity 23
   Price elasticity 24
   Income elasticity of demand 36
   Cross price elasticity of demand 38

3 Dynamic property market analysis 40
   Owner-occupied housing 40
   Technological change and the location of property 47

4 Market analysis for the factors of production in the assembly of property 56
   The market for land (with specific reference to building land) 56
   The market for construction materials and components 61
   The market for building labour 64
   Entrepreneurship and individual effort 69
   Productivity in the construction industry 72
   Innovation in the construction industry 77

5 Market forces, the property investor and their role in the creation of the built environment 83
   Conventional investment appraisal techniques 86
   Discounting techniques of investment appraisal 90
vi Contents

A critique of investment appraisal techniques 93
The determination of the economic life of a building 94

6 Government intervention in land and construction markets 107
Taxation and subsidization 107
Regulatory policy: health and safety in buildings and land use control 112
Price control policies 114

7 Market failure in the built environment 124
Externalities in the built environment 125
Urban policy and externalities 132
A conclusion on externalities 135
The case of public goods in the built environment 136
Monopoly situations in the built environment 138
Imperfect information in the urban market 139
Social views and the urban environment 141
A conclusion on market failure and the rationale for public intervention in the urban market 142

Part 2: Applied theory of the firm

8 Applied cost and revenue theory for construction and property 147
Revenues of the firm 148
Costs facing the firm 153
Normal profit 157
The profit maximizing rule 157
The long-run planning decision: the theory of long-run costs 158
Economies of scale 160
Diseconomies of scale 162
Conclusions on economies and diseconomies of scale 163

9 Market structures in construction and property 165
The theory of perfect competition and its application 166
The theory of monopoly and its application 175
The construction industry 183

Part 3: The economy and its management

10 A simple model of the economy for the property analyst 193
A macro-economic model 193
Demand in the economy 194
Supply in the economy 198
A simple demand and supply model of the macro-economy 199
The multiplier process 202
11 Primary economic objectives and the property sector  208
   A steady rate of economic growth  208
   A low and steady rate of inflation  215
   A low level of unemployment  217
   A balance of trade  217

12 Macro-economic management, property markets and the construction industry  219
   Demand management  220
   Fiscal policy  220
   Monetary policy  231
   A general overview of demand management  237
   Supply-side economics  238
   Local government macro-economic policy and the built environment  243
   Conclusion  244

Index  245
